**Annotation.** In this article, the author expressed his thoughts on the issues of the development of the green economy in the country and its role in the construction industry. In the context of the green economy, the specifics of the use of the material whose conditions are not important in the selection of the building material and environmental protection material are revealed.

**Keywords.** Green economy, market, construction products, construction industries, ecology, safety.

The country's structural reorganizations deepening, of the economy, the main sectors of modernization and diversification of the territory of a shore socio-economic development aimed at complex measures implemented are being. This with along, today's the day the world face which gives climate o' that zgarib conditions effective, resource efficient and environmentally safe economic units' in minlash main issues from one.

Of the economy sectors sanoatlashtirish and the population in the number of increase economy of the resource to the need of significant level increases, as well as, the surrounding environment of negative anthropogenic impact plans to strengthen and greenhouse gas separate to an increase lead has. Economy energy efficient low - level, natural resources nooqilona the use of, technology updates of lack, "green economy" to the development for innovative solutions to introduction in the environmental movement enough of the country 's sustainable development in the field of priority national goals and objectives to achieve prevent to.

Uzbekistan Republic President "2019 — 2030-year period O'time of uzbekistan republic of "green" economy in the transition strategy of approval on the" on PP-4477 number in the decision in the country 's green economy development of the economy bazaviy of the network energy efficiency is increasing, energy resources, consumption of diversification and re - renewable energy sources use development, climate change effects, to adapt and them to soften, natural resources use, the effectiveness of the increase and the natural ecosystem preservation, "green" economy support, financial and nomoliyaviy mechanisms work out the priority of a task as identified.

"Green economy" of the words of the meaning of quality, ecological basis for economic activity, maintaining the sense is used. This ecological environment protect to, natural resources are a simple and effective to use, its results the study and control to, as well as the human resources of the protection to be directed economic system. Green economy out increase to the ecological environment, attention, focus, energy efficiency increase, around the impressive changes to make and the mass of the knowledge and other problems the solution to the related economic mechanisms development is committed.

Construction industry is a many networks have their own into gets. Cement, asbestos-cement, of slate, asbestos-cement pipes, wall material (brick), lime, plaster, windows, windows, soft close materials, natural stone coating materials, trim and Polish to ceramic (ceramic) plates, heater radiators and konvektorlar, porcelain-faience, sanitary and building products, linoleum, folding iron-concrete structures and details, noruda building materials (ground, the bite of stone, sand, gravel, sand-gravel mixture) and other Building materials industry. let's see the main products is.

The green economy of the French are also widely spoken in your dog construction materials in the selection of important decisions, one environmental, and material protection that material protected use were the main focus. The following are a few materials for the mutual protection and the environmental consequences for maqbuldir:

**Solar, battery and energy efficient of the beds:** a green economy in the material building materials selection, energy economical bed and transplant battery important role earned is. This material re-work, re- ishlanuvchanligi and themselves cleaner in the type of be can with separated.

**Concrete alternate:** betonni his material protection and the environmental consequences because of, concrete alternative material use. For example, sand, traps, sharp stones and other material from the plant prepared the materials for his betonni instead of used.

**Derevomateriallar:** Derevomateriallar environment in protection of high material that is. It re-work and re-work it out easier make that for some reason, the green economy is widely applied.

**Composites materials:** Composites materials, a few material type combined a combination of is, the ancient of materials additional advantage with separated. In them the material protection and environmental cleaning concept widely popular.

**Re-renewable materials:** the material construction of the material and re-work through worked out and the protection is made of the material easy to ensure you can. Plastic, metal, paper and other materials re-used work produced building materials, a lot are used.

Green economy in material, building materials when choosing, the material to work out of, back to work, ability, material protection and ecological consequences,

energy costs and other concepts between good combination to looking is important. These associations mutual compatibility and proper financial results in providing help will.

Green economy is the development for a multiple tools and methods there are. This ecological environment protect to, natural resources simple and efficient to use, energy efficiency increase, human resources, and protect to, public knowledge and sensus the latest technology to use on its own into gets. The following are the many tools of green economy development , an important role has:

1. **Texnologiyalar and innovation:** New technologies and innovation for a green economy in the development of great importance to have. This technology, energy efficiency increase, around the impressive modifications with protection to make, around the impressive modifications with protection to make and the quality of products, the production and out to help will.

2. **Historical laws and political the way:** State and territory of the green economy development for legal and political personnel show through the way took. This green energy laws, environment protection, to be directed of the laws and quality problems, the solution to the direction towards political indicators with associated be can.

3. **Events and programs:** Green economy development for the state, businesses, and community organizations mutual cooperation to and green economy development aimed at activities and programs out is offered.

4. **Investments:** the green economy is the development for a large amount of investment require will. These investments in energy efficiency increase, environmental technologies development and environment protection to will be directed.

5. **Edukatsiya and sensus:** Public knowledge and sensus effectiveness in increasing an important role to have. Mass of green economy related to the environment and the transformations of the consequences about information able to be, them changes, spark adapted and green economy development contribute to add that it is important.

6. **Funds and financial resources:** Green economy development for the international fund and the financial resources used is important. These funds green energy, environmental infrastructure and quality of products manufacturing , to financial help it gives.

Environmental and xyou will pardon building materials in the selection, the environment is impressive change protect to and from public health protection to your attention that I give is very important. Environmental and xyou will pardon building materials xyou will pardon the tree on the surface of materials: the tree, the surface of the material of construction is very maqbuldir. The tree, the surface of the panel, device

and the tape public health and ensure to the best option is, they to the atmosphere loss do not carry and oksidlanmaydi. Composites materials: Composites materials natural material of the type with qarshilashtiriladi, however, them additional security to make for many chemical substances added. For example, kamlashtirilgan derevo plastic and penta polimerler this type of material is the example that is. Well izolatsiya the ability to have that materials, building energy costs lessg`accounted for ensures that. This material for the construction of energy distribution with associated cost reduces. You construction in the field of this direction of work to be made is also to the economy and the population for xyou will pardon of materials to use and the possibility of provides.
