Annotation: This article describes distance education, pedagogical technology, and the advantages of the Internet.

Keywords: pedagogue, technique, technology, information, online, psychologist.

It is known that in recent years, the education system in our country has been fundamentally reformed, and special attention is being paid to bringing up a mature generation who are worthy successors of our tomorrow. Therefore, under the leadership of our President, a number of laws and decrees related to the field, as well as state programs were developed, and based on this, many educational institutions were built anew, reconstruction works were carried out, and the most modern educational equipment and new computer equipment were provided. . Various science clubs, sports sections, and special language learning clubs in schools and technical lyceums have been attracting our youth. "This is a great opportunity that our country has created for the development of strong mature personnel who will serve in the way of the prosperity of our future. Honorable First President Islam Karimov said: "The future of our country depends on the future of our people, the prestige of our country in the world community, and first of all, how our children will grow up, grow up and enter life as human beings. "We should never forget the sharp truth" [1:1v] is a great motivation for us young people. It is known that now science and technology is developing rapidly. The field of pedagogy is developing new methods and technologies, new educational programs every day. Based on this, it would not be wrong to say that the interest in using modern pedagogical technologies in the educational process is growing day by day. Because pedagogical technology and interactive methods ensure that students acquire advanced skills and also increase their interest in the profession.

Modern pedagogy means the development of information technologies, computerization of education and providing information to the educational process in the system of computer networks. After all, as recognized in the organizational work on the implementation of the national program, "Formation and development of the system of providing information to education, connecting it with the world information system, defining the tasks of mass media in the field of education" is qualified. is one of the important criteria of personnel training. [2-11v] So, the new age is the age of information technologies. As a clear proof of this, distance education in the educational system, submission of online documents, as well as distance exams can be shown. This

made the educational system a lot easier for teachers and students. It is known that school pedagogues are trained every 3-5 years to retrain pedagogues-teachers and improve their qualifications. Before, school teachers from remote areas of our republic used to travel long distances to come to the city to study in order to increase their income. It was true that until the end of the leakage process, rent, bed and other problems would arise. Now, education Due to the development in the system, it was possible to study remotely. That is, pedagogues have been given the opportunity to improve their skills online through the Internet. Distance learning is also available for students. Having created new "Modul" and "Hemis" platforms for the Internet, during the quarantine, students studied remotely and even passed exams remotely. This is a huge achievement in the education system. Distance learning has its own set of challenges. This is because the internet does not work well in remote areas. The fact that the Wi-Fi network does not reach remote areas is an urgent problem of the distance education system, and large-scale work is being done to eliminate these problems. is the priority task of pedagogues. Raising young people is a very complicated process that requires a lot of attention and internal conflict. Therefore, the pedagogue should observe the formation-learning process of the pupil or student with great enthusiasm and meticulousness [2:7v]. At the meeting of the video selector on the issues of improving the education system in our country and accelerating the development of the field of science, the President said: "The quality, content, and atmosphere of education will not change unless the method of teaching at school changes" [3:8] criticizing the low quality of education in this field. He gave new assignments and tasks to overcome this problem. The head of our state said that it is necessary for young people to master modern science and high technologies, and all efforts and opportunities will be used for this. For this purpose, fundamental reforms were carried out in the education system, and a completely new system was established in the field - special schools for mathematics, chemistry, and biology were established in presidential and creative schools. is going "If we give timely attention and support to talented young people, I think they will achieve great victories" [3:3], he concluded. Our president. As I conclude my article, we will make good use of the many opportunities created for young people, study our field in depth, conduct in-depth research, develop into mature pedagogues and staff, and give education to the next generation, who will be the successors of our country. "I hope that we will perform our responsible duty wholeheartedly and justify the trust of our parents, our people, and our President!"
