**KIRISH**

Oltингugurt (Sulfur), S - Mendeleyev davriy sistemasining VI guruhiga mansub kimyoviy element. Tartib rakami 16, atom massasi 32,064. Tabiiy Oltингugurt 4 ta barkaror izotop 32S, 33S, 34S, 36S dan iborat. Sun’iy radioaktiv izotoplari 3IS, 35S, 37S ham olingan. Yer po‘stining massa jihatdan 5410~2% ini tashkil qiladi. Dengiz suvida 0,08—0,09% Oltингugurt bor. Tabiatda erkin (tug‘ma Oltингugurt) va birikmalar holida uchraydi.

**KIRISH**

Oltингugurtning eng muhim tabiiy birikmali metall sulfidlari, mas, FeS<sub>2</sub> — temir kolchedan (pirit), ZnS — aldama pyx, PbS — qo‘rg‘oshin yaltirog‘i yoki glenit, Cu<sub>2</sub>S — mis yaltirog‘i va h.k. Oltингugurt sulfatlar holida (angidrit CaSO<sub>4</sub> gips CaSO<sub>4</sub>·2H<sub>2</sub>O, og‘ir shpat BaSO<sub>4</sub>, glau-ber tuzi va q.k.) ham uchraydi. Bundan tashqari, Oltингugurt kumir, slanets, neft, tabiiy gazlar, hayvon va o‘simlik organizmlarida organik va anorganik birikmalar xrlida mavjud. Mas, oqsilda 0,8—2,4% Oltингugurt bor. Tug‘ma Oltингugurt Meksika, AQSH, Italiya, Yaponiya, MDH mamlakatlarida bir necha allotropik ko‘rinishlarda uchraydi. Ulardan muhimlari romb va monoklin singoniyalı Oltингugurtdir. Romb panjarali Oltингugurt sariqtusli, zichligi 2,07 g/sm<sup>3</sup> (20°da), suyuqlanish temperaturasi 112,8°, qaynash temperaturasi 445°. Sakkiz burchakli halqasimon Sg tarkibli molekulalardan tuzilgan. Monoklin Oltингugurt prizma shaklidagi tiniq kristallardan iborat, zichligi 1,96 g/sm<sup>3</sup>, suyuqlanish temperaturasi 118,9°. Oltингugurt qizdirilsa, 112,8° da erib, sariq tusli harakatchan suyuqlikka aylanadi. 160°da qo‘ng‘ir tusga kirib, qovushoq bo‘lib qoladi. Oltингugurt metalloidlar jumlasiga kiradi. U inert gazlar, azot, yod, platina, oltina&n tashqari deyarli barcha elementlar bilan birikadi. Kis-lorodda 250°da, qavoda 360° da alangalanadi.

**Birikmalari.** Oltingugurtning xalq xujaligida eng kup ishlataladigan birikmalardan biri vadarod sulfiddir. Tabiatda vadarod sulfid mineral suvlar va vulqon gazlari tarkibida uchraydi.

**H<sub>2</sub>S-Vadarod sulfide.** Monosulfon sulfonlar  $H_2S_n$  ( $n=1-8$ ) gomologik qatorning birinchi vakili rangsiz gaz, termik beqaror. Sovuq suvda yaxshi eriydi, kuchsiz kislota. Tingan eritma ( $\approx 0,1M$ ) vadarod sulfidli suv deb nomlanadi xavoda kup turganda loyqalanadi (ingibetor –saxoroza). Ishqorlar bilan netrallanadi. Kuchli qaytaruvchi oksidlovchi kislotalar galogenlar kislarod tipik oksidlovchilar, oltingugurt dioksid bilan xamda almashinish reaksiyalariga kirishadi.
